

Israel

A light Unto Nations. A world Leader in...

Irrigation Technology

The world laughed when Israel promised to make the desert bloom, but that's exactly what Israel did. Now the world looks to Israel for technology to make crops grow in areas where water is scarce, including parts of the US and third-world nations where people would otherwise starve.

As a result of innovations by Israeli scientists, farmers and the Jewish National Fund, Israel is now a leading exporter of agricultural products. Israel's irrigation technology has led to vineyards creating award winning wines, high quality fresh fruit that is exported to Europe, all from the Middle-East's only democracy.

The technology doesn't stop there. Israeli irrigation innovations are also being used in Africa around the world to end famine. Israeli greenhouse technology allows plants to be watered with computer controlled systems which deliver the exact amount of nutrients into the soil, thus lowering costs while maximizing plant growth with minimal resources. When farmers want to cut water usage and other costs while growing the best agricultural products anywhere, they turn to Israel.
